

Scientific Research

Ibrahem Elkamash, PhD

Physics Department, Faculty of Science, Mansoura University

8th Spring Plasma School at PortSaid (SPSP2023), PortSaid, Egypt.

March 7, 2023

What is Scientific Research

- a method of obtaining information in order to address a previously identified problem or question.

What is Scientific Research

- a method of obtaining information in order to address a previously identified problem or question.

- it represents a systematic method that follows many successive steps, that start from problem knowledge and analysis, collecting and documenting data to derive a range of solutions arising from the analysis.

What is Scientific Research

- a method of obtaining information in order to address a previously identified problem or question.

- it represents a systematic method that follows many successive steps, that start from problem knowledge and analysis, collecting and documenting data to derive a range of solutions arising from the analysis.

- systematic study designed to meet the lack of knowledge, to compile and link things and concepts spread or mixed in understanding or application, or to achieve new scientific knowledge derived from the procedures and results of scientific research.

Classification of Scientific Research #1

- Exploratory:
This type of research is used to explore new ideas or unanswered questions.

Classification of Scientific Research #1

- Exploratory:
This type of research is used to explore new ideas or unanswered questions.

- Descriptive:
This type of research is used to describe various phenomena.

Classification of Scientific Research #1

- Exploratory:
This type of research is used to explore new ideas or unanswered questions.

- Descriptive:
This type of research is used to describe various phenomena.

- Explanatory:
This type of research is used to explain why a particular phenomenon occurs.

Classification of Scientific Research #2

- Observational:
is a method of addressing hypotheses by simply observing. Observational research can take place in a laboratory or in a natural setting.

Classification of Scientific Research #2

- **Observational:**
is a method of addressing hypotheses by simply observing. Observational research can take place in a laboratory or in a natural setting.

- **Experimental:** is a method in which scientists manipulate variables in a controlled setting in an attempt to make a causal inference about the variables of interest.

Characteristics of Scientific Research #1

- Empirical: it can be verifiable. Persons should be able to verify the truth or otherwise of the said research work.

Characteristics of Scientific Research #1

- Empirical: it can be verifiable. Persons should be able to verify the truth or otherwise of the said research work.
- Objective: All scientific knowledge are objective as opposed to being subjective. This simply means that they are considered from the general perspective as opposed to being considered from the personal perspective.

Characteristics of Scientific Research #1

- Empirical: it can be verifiable. Persons should be able to verify the truth or otherwise of the said research work.
- Objective: All scientific knowledge are objective as opposed to being subjective. This simply means that they are considered from the general perspective as opposed to being considered from the personal perspective.
- Accuracy: A research work usually lays down the goals at the beginning stage and the results aimed to achieve at the end. This end result must be attained a 100 percent.

Characteristics of Scientific Research #1

- Empirical: it can be verifiable. Persons should be able to verify the truth or otherwise of the said research work.
- Objective: All scientific knowledge are objective as opposed to being subjective. This simply means that they are considered from the general perspective as opposed to being considered from the personal perspective.
- Accuracy: A research work usually lays down the goals at the beginning stage and the results aimed to achieve at the end. This end result must be attained a 100 percent.
- Systematic: a key feature of a scientific research is that it follows some particular steps and procedures and if these steps and procedures are repeated by any other person within a specific condition, the same result can be attained.

Characteristics of Scientific Research #1

- Empirical: it can be verifiable. Persons should be able to verify the truth or otherwise of the said research work.
- Objective: All scientific knowledge are objective as opposed to being subjective. This simply means that they are considered from the general perspective as opposed to being considered from the personal perspective.
- Accuracy: A research work usually lays down the goals at the beginning stage and the results aimed to achieve at the end. This end result must be attained a 100 percent.
- Systematic: a key feature of a scientific research is that it follows some particular steps and procedures and if these steps and procedures are repeated by any other person within a specific condition, the same result can be attained.
- Ethical consideration: Science must in some ways, put into consideration the values, morals, and ethical considerations of the society.

Characteristics of Scientific Research #2

- Reliable: any other person may replicate similar results by following the systematic procedures laid down.

Characteristics of Scientific Research #2

- Reliable: any other person may replicate similar results by following the systematic procedures laid down.
- Predictable: at the very early stages of the research work, a researcher should be able to predict the outcome.

Characteristics of Scientific Research #2

- Reliable: any other person may replicate similar results by following the systematic procedures laid down.
- Predictable: at the very early stages of the research work, a researcher should be able to predict the outcome.
- Replicable: The fact that a research conducted in a lab in Europe can be replicated in Africa and a similar result attained qualifies such research as being scientific.

Characteristics of Scientific Research #2

- Reliable: any other person may replicate similar results by following the systematic procedures laid down.
- Predictable: at the very early stages of the research work, a researcher should be able to predict the outcome.
- Replicable: The fact that a research conducted in a lab in Europe can be replicated in Africa and a similar result attained qualifies such research as being scientific.
- Controlled: specific variables to be known as the knowledge of these variables allow for ease of repeating the said research work.

Characteristics of Scientific Research #2

- Reliable: any other person may replicate similar results by following the systematic procedures laid down.
- Predictable: at the very early stages of the research work, a researcher should be able to predict the outcome.
- Replicable: The fact that a research conducted in a lab in Europe can be replicated in Africa and a similar result attained qualifies such research as being scientific.
- Controlled: specific variables to be known as the knowledge of these variables allow for ease of repeating the said research work.
- have a definite objective: all scientific research works have a specific objective or goal as the end result in the mind of the researcher.

Steps of Scientific Research

The seven stages that research should follow to be scientific are:

- Make an observation or ask a question: observe an interesting phenomenon and form a research question.

Steps of Scientific Research

The seven stages that research should follow to be scientific are:

- Make an observation or ask a question: observe an interesting phenomenon and form a research question.
- Gather background information: make an overview of the previously published literature on the topic that you're interested in.

Steps of Scientific Research

The seven stages that research should follow to be scientific are:

- Make an observation or ask a question: observe an interesting phenomenon and form a research question.
- Gather background information: make an overview of the previously published literature on the topic that you're interested in.
- Create a hypothesis: specifying the purpose of your research, devising a framework research design, and outlining specific research questions.

Steps of Scientific Research

The seven stages that research should follow to be scientific are:

- Make an observation or ask a question: observe an interesting phenomenon and form a research question.
- Gather background information: make an overview of the previously published literature on the topic that you're interested in.
- Create a hypothesis: specifying the purpose of your research, devising a framework research design, and outlining specific research questions.
- Make a prediction based on the hypothesis: researchers should conduct background research before conducting research and make a guess/prediction of what they expect to happen when testing the hypothesis.

Steps of Scientific Research

The seven stages that research should follow to be scientific are:

- Make an observation or ask a question: observe an interesting phenomenon and form a research question.
- Gather background information: make an overview of the previously published literature on the topic that you're interested in.
- Create a hypothesis: specifying the purpose of your research, devising a framework research design, and outlining specific research questions.
- Make a prediction based on the hypothesis: researchers should conduct background research before conducting research and make a guess/prediction of what they expect to happen when testing the hypothesis.
- Test the hypothesis: carry out empirical research to test the hypothesis.

Steps of Scientific Research

The seven stages that research should follow to be scientific are:

- Make an observation or ask a question: observe an interesting phenomenon and form a research question.
- Gather background information: make an overview of the previously published literature on the topic that you're interested in.
- Create a hypothesis: specifying the purpose of your research, devising a framework research design, and outlining specific research questions.
- Make a prediction based on the hypothesis: researchers should conduct background research before conducting research and make a guess/prediction of what they expect to happen when testing the hypothesis.
- Test the hypothesis: carry out empirical research to test the hypothesis.
- Analyse the data: the researcher should analyse the gathered data to identify if it supports or rejects the hypothesis proposed.

Steps of Scientific Research

The seven stages that research should follow to be scientific are:

- Make an observation or ask a question: observe an interesting phenomenon and form a research question.
- Gather background information: make an overview of the previously published literature on the topic that you're interested in.
- Create a hypothesis: specifying the purpose of your research, devising a framework research design, and outlining specific research questions.
- Make a prediction based on the hypothesis: researchers should conduct background research before conducting research and make a guess/prediction of what they expect to happen when testing the hypothesis.
- Test the hypothesis: carry out empirical research to test the hypothesis.
- Analyse the data: the researcher should analyse the gathered data to identify if it supports or rejects the hypothesis proposed.
- Conclusions: the researcher should state whether the hypothesis was

General Tips

- Walk before you run.

General Tips

- Walk before you run.
- For curiosity not practicality
